

Coding Test

Role: Senior Fullstack Developer

Fork the rupees <https://github.com/almirbi/rupees> **repository and run it.**

Take a look around. There are a couple of features implemented:

- register
- login
- two roles, buyer and seller
- deposit Rupees
- buy product with deposited Rupees
- create products
- single session per user and a logout all form
- release all Rupees

Your task is to:

- Add a new field to the product, productImage, update the product creation form and show the image in product list
- Create a UI scheduling component, and add it to the product creation form. The scheduler should offer the functionality to pick a date and time in the future when the product will expire. If the product is expired, it is displayed as such in the product list. A product cannot expire on weekends. An expired product cannot be bought.
- Make the product list editable by the seller who owns those products. The editable fields should be: the amount available, product name, cost, product image and the expiry.

Push your forked repo to GitHub and send us a link back 😊

Take maximum 1-2 hours to complete this task, and make the necessary decisions in accordance with this time limit and prioritising clean code.
